

THE 30-SECOND PITCH

The AI brain for your HPE NonStop systems.

Navigator reads your NonStop source code the way a senior developer would — except it never retires, works in **hours, not weeks**, and documents everything automatically.

HOW IT WORKS

THE PROBLEM

Your HPE NonStop systems hold **30+ years of business-critical knowledge. Most of it is trapped in code no one fully understands anymore.**

01 Experts retiring Decades of context walking out the door, undocumented.	02 No documentation What was written down is years out of date — or never existed.	03 Modernization stalled Teams cannot safely change what they cannot understand.
--	--	--

CORE CAPABILITIES

01 Business rule extraction Captures complex logic in COBOL, TAL, and TACL in plain business language.	02 Automated documentation Generates program guides directly from raw source code — no manual effort.
03 Conversational chat Answers questions like "how does credit approval work?" in seconds.	04 Impact & dependency analysis Visualizes data flows, cross-program dependencies, and change impact.

LANGUAGES SUPPORTED

COBOL	SCOBOL	TAL	pTAL
TACL	C / C++		

WHY ONLY NAVIGATOR

- NonStop-aware prompting (TMF, process pairs, Guardian)
- Preprocessing engine for very large programs
- Multi-model approach — pick your LLM
- Human-in-the-loop validation by NonStop specialists

THE BUSINESS CASE

Two ways to run a NonStop estate.

WITHOUT NAVIGATOR

The status quo.

- Weeks of manual code review
- Knowledge locked in retiring experts
- New hires take 6–12 months to ramp
- Modernization stalls
- Business and IT speak different languages
- Every change is a risk

WITH NAVIGATOR

What changes.

- + Weeks become days for full understanding
- + Business rules documented automatically
- + New developers productive in days
- + Full impact analysis before any change
- + Plain-language answers via chat
- + Institutional knowledge preserved forever

DEPLOYMENT FLEXIBILITY

"We can't send our source code to the cloud." You don't have to.

OPTION A

Public Cloud LLM

Fastest, smartest.

OpenAI · Anthropic · Google

Accessed via API. Best-in-class intelligence with no infrastructure to manage.

OPTION B

Private Cloud (VPC)

Zero data exposure.

AWS · Google Cloud · Azure

LLM deployed inside your own VPC. Source code never crosses your account boundary.

OPTION C

On-Premise Local LLM

100% air-gapped.

Llama 4 · Gemma 4 · DeepSeek

Runs entirely inside your building, on your hardware. Nothing leaves the network.

The question isn't *if* Navigator works in your environment — it's **which deployment fits your security policy.**

IF THEY SAY

"Nothing to the cloud"

Navigator runs 100% on-premise. Source code never leaves the building.

IF THEY SAY

"We use private cloud"

Navigator deploys inside your VPC. Zero third-party exposure.

IF THEY SAY

"No restrictions"

You get the best models — GPT-5.5 or Claude Opus 4.7. Maximum speed and intelligence.

The question isn't whether you need this. It's

which program do you want us to analyze first.
