

uLinga for Enterprise Extender

SNA between hosts and servers, natively over IP — while still retaining your SNA APIs.

Retire SNA, keep your applications

Proprietary SNA infrastructure restricts flexibility and adds cost and complexity. uLinga for EE lets HPE Nonstop and IBM mainframe users **migrate from SNA to TCP/IP** quickly and reliably — eliminating SNA from critical parts of the network, even the last-wire "tails" — **with no changes to application code**. Applications keep running as SNA applications while you gain end-to-end IP visibility.

Enterprise Extender (HPR/IP)

UDP/IP

Fault-tolerant links

No application changes

What uLinga for EE delivers

EE / APPN node

Participate in the SNA APPN world as an EE node — retaining access to CICS, IMS and TSO, reducing VTAM definitions, with UDP/IP fault tolerance across redundant links.

Native Nonstop interfaces

Support for HLS, SNAX/APC, SNALU, CRT, Raw Socket and IPC — so existing Nonstop SNA applications keep working unchanged.

Online configuration & tracing

The same online configuration used across the uLinga suite, plus industry-standard Wireshark tracing with compression to reduce storage.

WebCon management

Manage and control the process from any web browser through an intuitive graphical interface, secured with built-in TLS 1.2.

Benefits

Reduce costs — retire costly SNA infrastructure

Minimize risk — no application code changes

Boost flexibility — modern, standard UDP/IP

Strengthen security — leverage IPsec & platform tools

✓ A **modern, vendor-supported alternative** to legacy HPR/IP products — a proven, less-expensive path from SNA to IP, already live in production, from a team well-versed in SNA on HPE Nonstop.
