

uLinga for Kafka

Lightweight, high-performance Kafka streaming for HPE Nonstop data and applications.

A different approach

uLinga for Kafka runs as a **natively compiled Guardian process pair** and speaks the Kafka protocols **directly over TCP/IP** — with no Java libraries and no intermediate database. It communicates straight with the Kafka cluster for the best possible performance, avoiding the extra platform, single point of failure and latency that other Nonstop Kafka solutions introduce.

Kafka Producer

Kafka Consumer

No application changes

Online configuration

Stream data to & from Kafka

Pathsend & Guardian IPC

Applications send and receive data directly over IPC or Pathsend with minimal code changes — lowest possible latency.

TMF audit & Enscribe files

Monitor TMF audit trails and stream changes; FILEREADER/WRITE for entry-sequenced files; Intercept Library for relative & key-sequenced.

HTTP / REST

Route web requests to Kafka through uLinga's built-in HTTP interface — no extra middleware required.

Transform & manage with ease

Configurable **data transformation** converts records to and from any combination of formats, so data lands in Kafka ready for consumers across the enterprise:

Binary / DDL

ISO 8583

JSON

AVRO

Guardian reliability

Native process pair,
proven performance

Online config

No app changes, no
extra servers

WebCon control

Browser admin, TLS
1.3 secured

Built-in tracing

Standard Nonstop
logging

Sample Nonstop use cases

Stream **logs & system events** to Splunk and other tools

Replicate **data changes** to SQL Server or Oracle

Async **messaging** to Windows / Linux apps

Keep Nonstop data **in sync with cloud** services

✓ **Native Guardian performance & reliability** · ✓ **no extra software or servers** · ✓ **no application changes** — the simplest, lowest-risk way to bring Nonstop into your Kafka streams.

uLinga for Enterprise Extender

SNA between hosts and servers, natively over IP — while still retaining your SNA APIs.

Retire SNA, keep your applications

Proprietary SNA infrastructure restricts flexibility and adds cost and complexity. uLinga for EE lets HPE Nonstop and IBM mainframe users **migrate from SNA to TCP/IP** quickly and reliably — eliminating SNA from critical parts of the network, even the last-wire "tails" — **with no changes to application code**. Applications keep running as SNA applications while you gain end-to-end IP visibility.

Enterprise Extender (HPR/IP)

UDP/IP

Fault-tolerant links

No application changes

What uLinga for EE delivers

EE / APPN node

Participate in the SNA APPN world as an EE node — retaining access to CICS, IMS and TSO, reducing VTAM definitions, with UDP/IP fault tolerance across redundant links.

Native Nonstop interfaces

Support for HLS, SNAX/APC, SNALU, CRT, Raw Socket and IPC — so existing Nonstop SNA applications keep working unchanged.

Online configuration & tracing

The same online configuration used across the uLinga suite, plus industry-standard Wireshark tracing with compression to reduce storage.

WebCon management

Manage and control the process from any web browser through an intuitive graphical interface, secured with built-in TLS 1.2.

Benefits

Reduce costs — retire costly SNA infrastructure

Minimize risk — no application code changes

Boost flexibility — modern, standard UDP/IP

Strengthen security — leverage IPsec & platform tools

✓ A **modern, vendor-supported alternative** to legacy HPR/IP products — a proven, less-expensive path from SNA to IP, already live in production, from a team well-versed in SNA on HPE Nonstop.
